SMART INDIA HACKATHON 2026

Problem Statement ID: SIH26251

Problem Statement Title: Indian Army - Predictive Logistics & Forward Supply Chain

Theme: Transportation & Logistics

PS Category: Software

Team ID: 185972

Team Name: Subterra Mesh

Solution: DRONA-LOG: AI-driven predictive logistics and terrain-aware supply optimisation

SUBTERRA MESH

PROPOSED SOLUTION

SMART INDIA HACKATHON 2026

The problem

Demand, stock, transport capacity and terrain/weather data sit in separate streams, so static plans fail when a pass closes.

Our solution

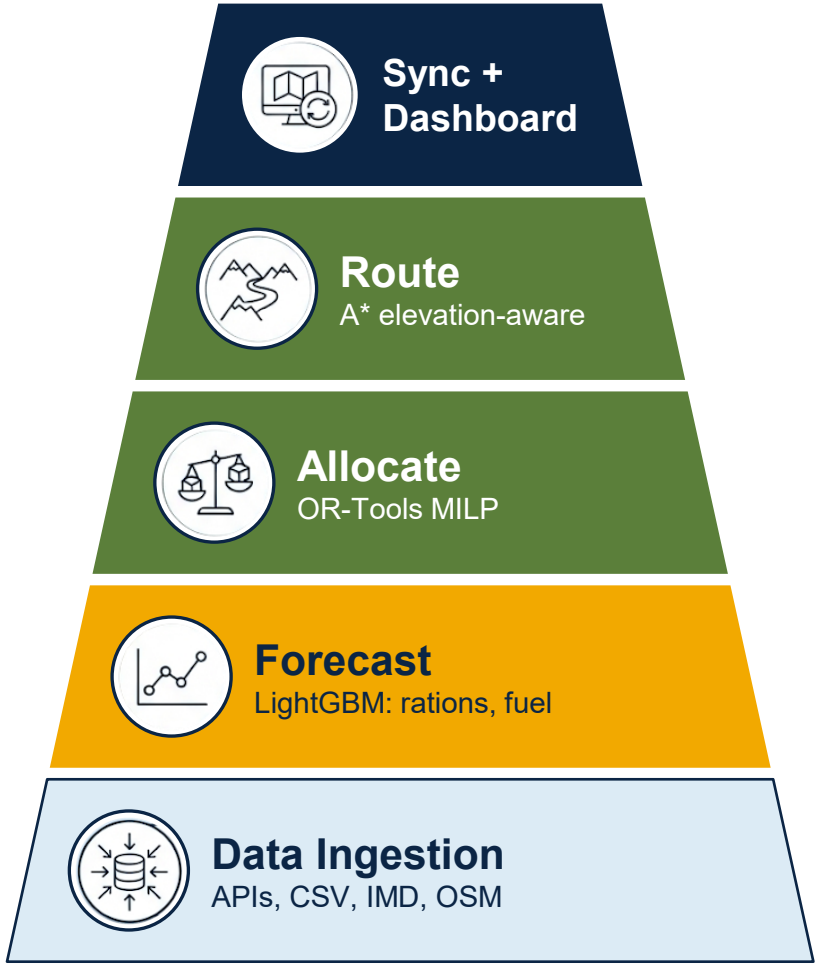

DRONA-LOG forecasts ration and fuel demand, optimises allocation and re-routes supplies in one integrated system.

What is different

Map-first UI, terrain-aware routing, closed-loop re-planning, and an offline-first field client that syncs when the network returns.

▶ Demo Video
2:33 narrated walkthrough

Prototype
GitHub · run locally

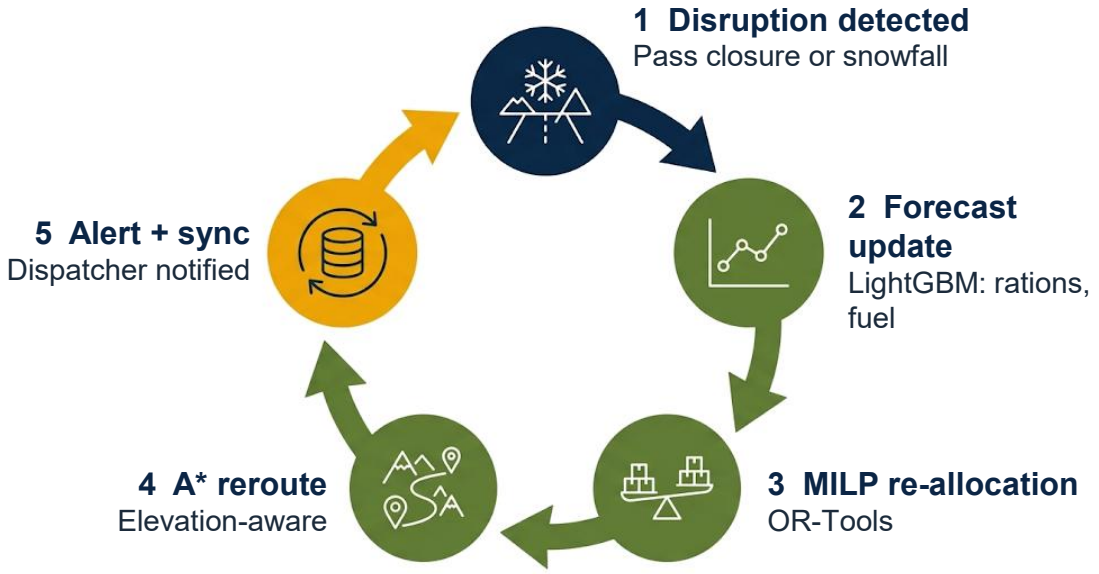

- Snowstorm / pass closure
- Dynamic rerouting
- Network outage
- Offline queue and sync
- Static schedules
- Predictive forecasting

SUBTERRA MESH

TECHNICAL APPROACH

SMART INDIA HACKATHON 2026

Methodology: closed-loop re-planning

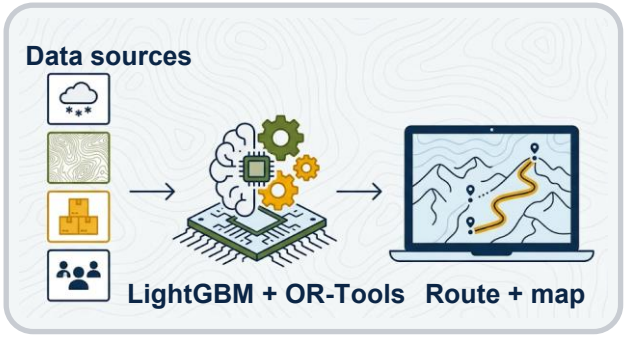

Measured: 15.4 ms reroute and 439 ms re-solve after Zojila closure (sample run).

Detailed Report
Architecture · API · tests

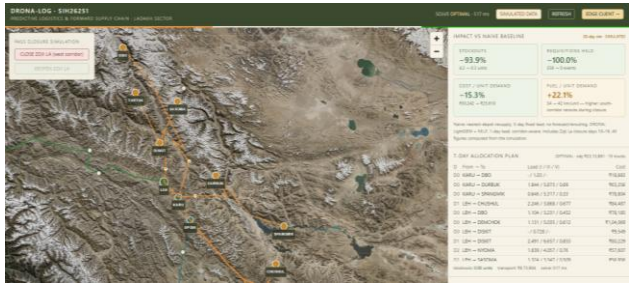

Data-to-decision pipeline

Offline-first sync

Field laptop works offline and syncs to the command server when the network returns.

Offline map, live KPIs and plan

TECHNOLOGIES USED

Frontend
React · MapLibre GL · Vite

Backend (Python) and data
FastAPI · SQLite

AI and optimisation
LightGBM · OR-Tools · NetworkX

Deployment
Docker

SUBTERRA MESH

FEASIBILITY AND VIABILITY

SMART INDIA HACKATHON 2026

Technical Feasibility

- Runs on standard field laptops and private servers
- Open-source stack: LightGBM, OR-Tools, NetworkX, SQLite
- Optimisation enforces inventory, capacity and demand constraints
- Offline-first: local SQLite store syncs when the network returns

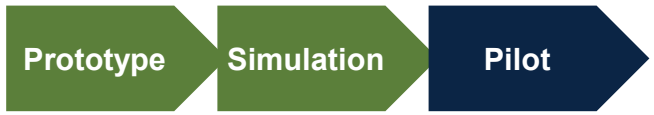

Operational Viability

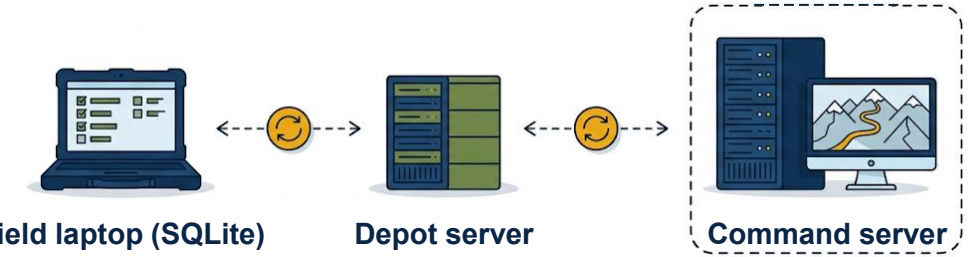

- Predicts shortages and triggers stock alerts early
- Traceable records and reliable synchronisation
- Fewer avoidable trips cut transport cost and fuel waste
- Extends to other remote, disruption-prone supply networks

Risks and Mitigation

Risk	Mitigation
No real military data	Synthetic data; pilot validation
Weak or no connectivity	Offline queue and sync
Data sensitivity	On-prem or air-gapped; encryption; role-based access
Rare-event model error	Safety-stock buffers; human override

Phased rollout

Security: the command server stays on-prem or air-gapped. Field laptops keep data locally and sync only when a link is permitted.

SUBTERRA MESH

IMPACT AND BENEFITS

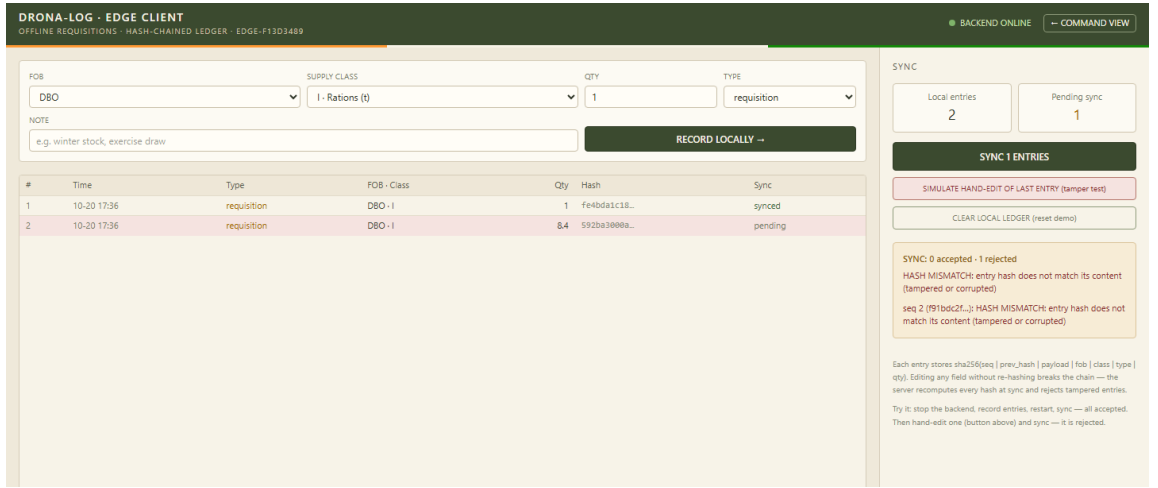

SMART INDIA HACKATHON 2026

Stockout prevention
Forecast demand and maintain safety stocks.

Faster decisions
Recalculate allocations and routes after disruptions.

Fuel efficiency
Optimise vehicle assignments and supply routes.

Offline continuity
Keep local records during network outages.

Live edge UI — offline ledger rejects a tampered entry

Who benefits: logistics officers, depot commanders, formation HQ and troops at forward posts.

439 ms — MILP re-solve after Zojila closure (sample run)

–93.9% — Stockout units vs naive baseline (30-day SIMULATED)

0 — Tampered ledger entries accepted by the server (SHA-256 verification)

Measured in the seeded prototype; operational figures SIMULATED.
